Efl-2 (also known as EHK-IL) is an Eph transmembrane tyrosine kinase family ligand. It has homology with B61 (Efl-1) (see AAR82604). Efl-2 ends in a C-terminal hydrophobic sequence that appears to to be a recognition sequence allowing it to be GPI-linked and thus lacking in an intracellular domain. Efl-2 is useful for identifying other ligands for Ehk-1, -2, -3, Eck and Elk receptors. The ligands are useful in promoting a differential function and/or influencing the phenotye, such as growth and/or proliferation, of receptor bearing cells. They may be used in the diagnosis, and treatment of neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 IYCPHYNSSGVGPGAGPGGGGAEQYVLYMVSRNGYRTCNASQGFKRWECNRPHAPHSPI 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is that of a novel protein designated hek-L, a protein that can bind hek (a cell surface receptor tyrosine kinase). Hek-L is the first known ligand for hek and can be used to study cellular processes regulated by hek (which may be involved in tumorisenesis). It is also an immunogen for antibody production, as a reagent for detecting hek or hek-L in in vitro assays, to determine binding of hek proteins, to purify hek proteins, and to carry diagnostic or cytocoxic agents to particular leukaemia cells that express the hek antigen. Hek-L also binds the elk tyrosine kinase receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           181 LPQFTMGPNVKINVLEDFEGENPQVPKLEKSISGTSPKREHLPLAVGIAFFLMTFLAS 238

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel mouse EPH receptor ligand, Elf-1 (AAR94766), is involved in the formation and maintenance of ordered spatial arrangements of differentiated tissue. It is the product of a cDNA clone (AAT15008) obtd. from an embryo mid- and hind-brain cDNA expression library. This cDNA is used for the prodn. of recombinant Elf-1, which can be used to modulate proliferation, survival and/or differentiation of cells and tissues, and to stimulate or antagonise intracellular signal transduction pathways mediated by the EPH-type receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4 agrpllpllll----llplrarnedparanadryavywnrsnprfqvsavgdgggytvev 59

This ligand can bind to both mek-4 and sek-AP. Elf-1 is a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended for transplantation), also therapeutically in increase neuron survival (e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tunnours, to induce differentiation of hepatocytes to form an artificial liver, to induce cartilage and bone

The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the cohancement, stimulation, proliferation or growth of cells expressing the chart of all receptor. The ligand and receptor complex may be involved in neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural itssue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating cure undergenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the energy or the elk or hek cell surface receptor. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                            LERK-6 polypeptide; hek receptor; elk receptor; human; murine; injury; cell proliferation; neural growth; neural tissue; neurological disease; neurodegenerative; excitotoxicity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymersae chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantiteting a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypetide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations

                                                                                                                                                                                                                                                                                                                    the formation and maintenance of ordered spatial arrangements of differentiated tissue. It is the product of a cDNA clone (AATISO09) obtd. from an embryo cDNA expression library. This cDNA is used for the prodn. of recombinant Elf-1, which can be used to modulate proliferation, survival and/or differentiation of cells and tissues, and to stimulate or antagonise intracellular signal transduction pathways mediated by the EPH-type receptor.

                                                                                                                                                                                                The present sequence represents an avian EPH receptor ligand designated Elf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 is a phyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended fo transphatation), also therapeutically in increase neuron survival e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of

Human AL-1 (AAR97854) neurotrophic factor is a ligand for eph-related tyrosine kinase receptor REK7 (AAR97853). Its amino acid sequence was deduced from a cDNA clone (AAT18897) isolated from a human foetal brain cDNA library. Recombinant, mature AL-1 can be produced in transformed host cells. It may be useful in promoting the development, maintenance or regeneration of neurons in vivo, and can be utilised in methods for the diagnosis and/or treatment of neurological disorders. It can also be used to promote or enhance angiogenesis. Antegonists and agonists of AL-1, as well as antibodies raised against AL-1, also have therapeutic applns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      || :: ||||:|| | ||:|||:

                                                                                                                                                                                                                                                                                               δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of human Lerk-7 protein. Lerk-7 is predicted to be anchored to the cell surface via glycosyl-phosphatidylinositol (GPI) linkage. A GPI anchor attaches to the exposed C-terminal amino acid of the processed mature protein, usually after cleavage upstream, often about 10-12 amino acids, of the N-terminus of the hydropholic domain. Lerk-7 coding sequence (AAPI3209) was isolated using a probe derived from the murine Lerk-6 DNA (AAPI37700). The Lerk-7 gene and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and can be used to treat neural tissue disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated human Lerk-7 cytokine - which binds to cell surface receptors elk, hek and eck, useful for delivering agents to cells or for treating neural disorders

Human HEK4 binding protein (HEK4 BP) (AAW00035) binds to and activates HEK4 and ECK receptors. Its amino acid sequence was deduced from a cDNA clone (AAM134292) isolated from a human placenta cDNA library. Expression vectors and host cells can be used for the prodn. of biologically active HEK BP. It is useful for modulating the growth and/or differentiation of EGH sub-family receptor-bearing cells, esp. in liver, kidney, lung, skin or neural tissues. It can be used to treat neural system disorders and in the regeneration of

and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and can be used to treat neural tissue disorders.

A fragment of murine Lerk-6 DNA was isolated by PCR for use as a probe for a human Lerk-6 homologue. The probe however led to the identification of a human Lerk-7 gene (see AAT32699). The Lerk-7 gene

The LERK-6 polypeptide encoded can be used to isolate cells expressing hek/elk cell surface receptors, or to measure the biological activity of such receptors. The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may be treated by

The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the enhancement, stimulation, proliferation or growth of cells expressing the neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating curvey degenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the large.

The B1 protein sequence was deduced from the cDNA sequence obtd. by screening a cDNA library from human umbilical vein endothelial cells with radiolabelled cDNA fragments derived from the 5' end of B61 DNA. The B1 protein has 205 residues (24 kD) comprising a signal sequence and hydrophobic N- and C- terminal regions. The B61 gene is involved in early inflammatory response and serves as a marker. It may be detected by probes or by antibody-based immunoassay of biological fluids such as plasma, CSF or urine. These assays make it possible to predict a worsening in a disease process and allow the quantitative assessment of the magnitude of the inflammatory response. This information will allow the earlier admin. of appropriate therapy, thereby shortening the disease process and limiting the patient's exposure to anti-inflammatory/immunocustive therapy. B61 induction is rapid and profound, hence

Nicontains: coat protein VP1; coat protein VP2; coat protein VP3; coat protein VP4; c A-directed RNA polymerase (EC 2.7.7.48)
Adirected RNA polymerase (EC 2.7.7.48)
C; Species: human poliovirus 3
C; Species: human poliovirus 3
C; Accession: A27245
R; Hughes, P.-J.; Evans, D.M.A.; Minor, P.D.; Schild, G.C.; Almond, J.W.; Stanway, G. A; Ritle: The nucleotide sequence of a type 3 poliovirus isolated during a recent outb A; Reference number: A27245; MUD: 87010550
